

Your liaisons know twelve homes in Mesa.

Arizona has around 2,600 licensed senior living homes. The rest of the territory is invisible: homes with open rooms, homes that would refer, homes nobody has ever called.

ElderLogic holds all of them, with the state's own licensing and inspection record on each one. Then a person on our team does the calling. That combination is the product.

Read how it works

PLAINLY

What happens, in order

One placement, start to finish. No argument in this section.

01 An assessment is filled in

It creates the client record, the power-of-attorney record and the placement search in one pass. Only the critical fields are required.

02 The search returns every licensed home in range

Around 200 of them, each carrying its AZDHS licensing, inspection, violation and enforcement history. Homes your organisation has blacklisted are already gone.

03 Our team screens them and makes the calls

We read the state record, contact the homes, confirm who has a room for this patient, and agree the price.

04 You receive a shortlist that will take the patient

Five or so homes with a confirmed room and an agreed price.

05 The shortlist becomes a routed day

Pre-tour visits in order on a phone, re-optimised when the day changes, with a short form at each stop. The same route can be sent to the family and opens in Google Maps.

06 The move-in is recorded

Which client, which home, what price, what date. A home that failed its visit stays out of every future search.

The same map runs territory work: select an area and get every licensed home inside it, in a routed order. ElderLogic does not replace an EMR or a CRM. It handles placement and territory work.

THE CONCIERGE

Two hundred homes in the radius. Five you can actually use.

The search is the easy half. Somebody still has to read the state record, make the calls, find out who has a room today, and agree what it costs. That is our team, not yours.

Homes your organisation has blacklisted drop out before any contact begins. Your liaisons see the homes that work.

FIGURES FROM A REPRESENTATIVE PHOENIX-AREA SEARCH

It starts with one form

The assessment creates the client record, the power-of-attorney record and the placement search together. Only critical fields are required, so a home can give a fast yes or no and the search can go out the same day.

This is the territory, not a sample of it.

Homes decide which hospice gets called when a resident starts declining. A liaison can only build that relationship with homes they know exist. Every home here carries contact details and its full state record, and any area drawn around them becomes a day of visits.

Licensed homes, Phoenix metro

Source: AZDHS · refreshed monthly · around 2,600 statewide as of August 2026

WHY TERRITORY PAYS

A referral from assisted living stays on service longer.

Patients referred from assisted living average around 150 lifetime days on hospice. Referrals from home average around 87. Coverage of the homes in your territory is the input to that number, and census is what an owner is measured on.

Before a visit, we contact the homes on the route with your placement pitch. The liaison arrives somewhere that already wants the meeting: a resident who might fit, and no placement agent fee for the home to pay.

150

average lifetime days — referred from assisted living

87

average lifetime days — referred from home

A day of visits is set up in one screen

A liaison picks the date, the time and the area. Every licensed home inside it comes back with contact details and history, ordered into a route they can drive.

IN THE FIELD

The day arrives as a route, not a list of addresses.

Stops in order, re-optimised when the day changes.

Everything a liaison needs at a stop is one tap away, and the form afterwards is short, because a long form never gets filled in a car park.

AT EVERY STOP

Navigate

The next stop opens in the phone's own maps app. The route re-optimises when a visit runs long or a home cancels.

A home your team rejects after a visit is blacklisted once and stays out of every future search for everyone in the organisation.

THE STATE RECORD

We do not tell you a home is good. We show you what the state published.

Every home carries its full AZDHS history, not only its current status. It is refreshed monthly, and one click from anywhere in the workflow opens the official state file. Your team reads it and decides.

Licensing	Full history
Inspections	Full history
Violations	Full history
Enforcement	Full history
Source document	One click to AZDHS

No scores, no ratings, no rankings. ElderLogic surfaces the published record and nothing else.

The family can be sent the same route.

By text or email, opening in Google Maps. They drive the tour in the order it was planned, without a phone call to arrange it.

Records and reporting, if you want them.

Move-in records, completed and missed visits, activity by liaison, and a monthly report. Available as an add-on for teams that report upward.

BOOK A DEMO

Bring your territory to the demo.

Twenty minutes. We open the map on the area your liaisons cover and you can see what is in it.

Questions we get

Where does it work?

Arizona today. More states are planned.

Does it work on a phone?

Yes, including routes, home details and post-visit notes. Most use is in the field.

Who makes the calls?

Our team. Screening, contact and price negotiation are done by a person, not automated.

Does it replace our EMR or CRM?

No. It handles placement and territory work and sits alongside what you already run.

Where does the home data come from?

The Arizona Department of Health Services. Licensing, inspection, violation and enforcement history, refreshed monthly.

Do you rate the homes?

No. The state publishes a record and we show it to you. Your team decides.
