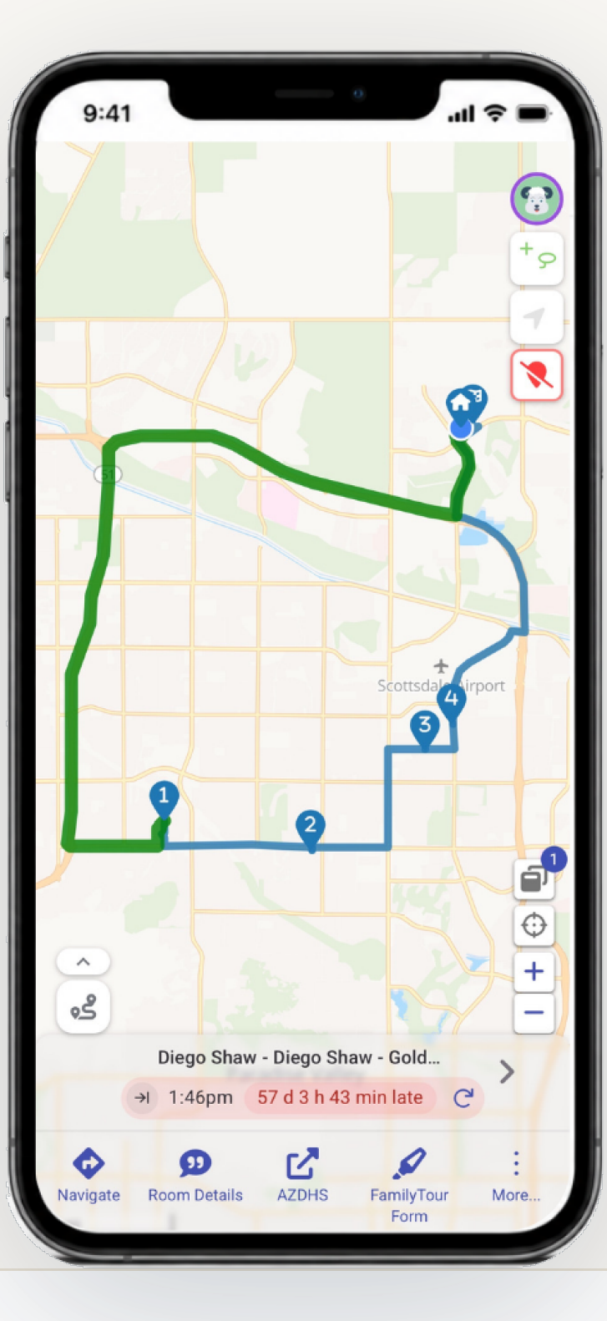
Cover the whole territory. We make the calls.

ElderLogic is placement and outreach software for hospice teams in Arizona. Our staff contact the homes, confirm a room and agree a price, so your reps spend the day in front of people instead of on the phone.

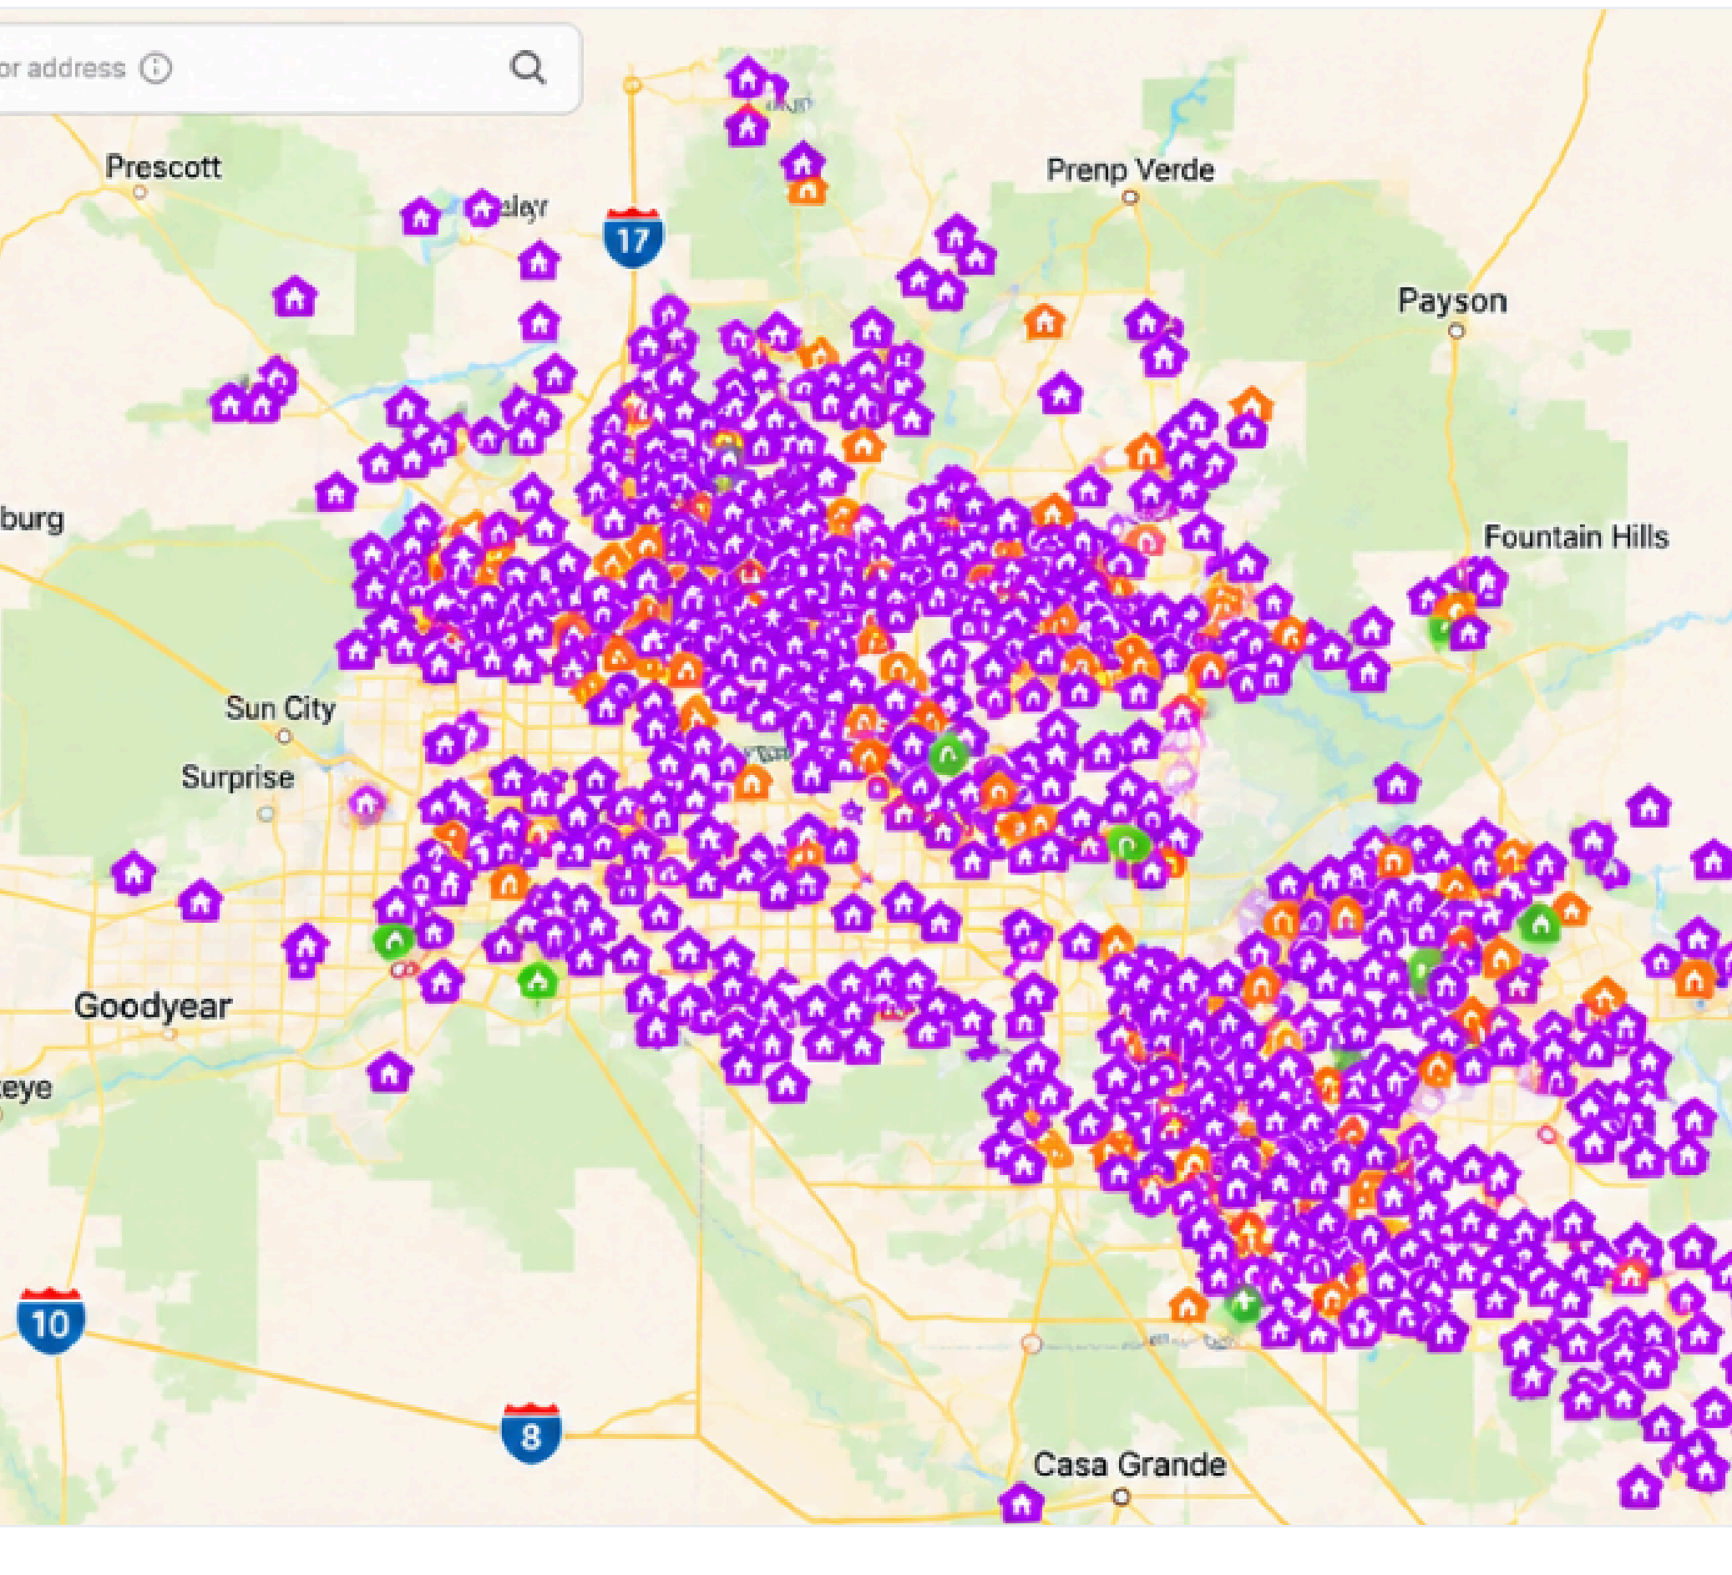
Request a walkthrough

What it is



A liaison works from the homes they can name.

There are usually about a dozen. Arizona has around 2,600 licensed senior living homes. Every one of them decides which hospice gets called when a resident starts to decline.



`Licensed senior living homes, Phoenix metro. AZDHS licensing file · around 2,600 statewide as of 1 Aug 2026.`

The other half of the problem has a date on it.

A patient has a discharge date. The coordinator working the phones against it loses days finding a home that has a room, will take this patient, and will take this price.

One assessment goes out and the calling starts the same day.

What ElderLogic is.

A company in Arizona. An app holding every licensed senior living home in the state, each one carrying the licensing, inspection, violation and enforcement history AZDHS has published about it. And staff who read that record, call the homes, confirm a room and agree a price.

It is sold to an organisation and used by a team. Reps share a territory, a home your organisation rules out stays out for everyone, and a manager can see what was done.

Who does the work

Every piece of work on this page is marked with who does it. Half of it is not done by your team.

— Your team — Our staff — The software ··· The state

···· The state

Every licensed senior living home in Arizona, each one carrying its published AZDHS record.

— The software

Search and matching across the territory, filtered to what this patient needs.

— The software

Pre-tour routes for a client, in a drivable order, on a phone.

— Your team

Visit records, move-ins, and reporting on what the team did.

— Your team

Client, power-of-attorney and placement records, held in one place.

— Our staff

Outreach to the homes, and every reply collected against the search.

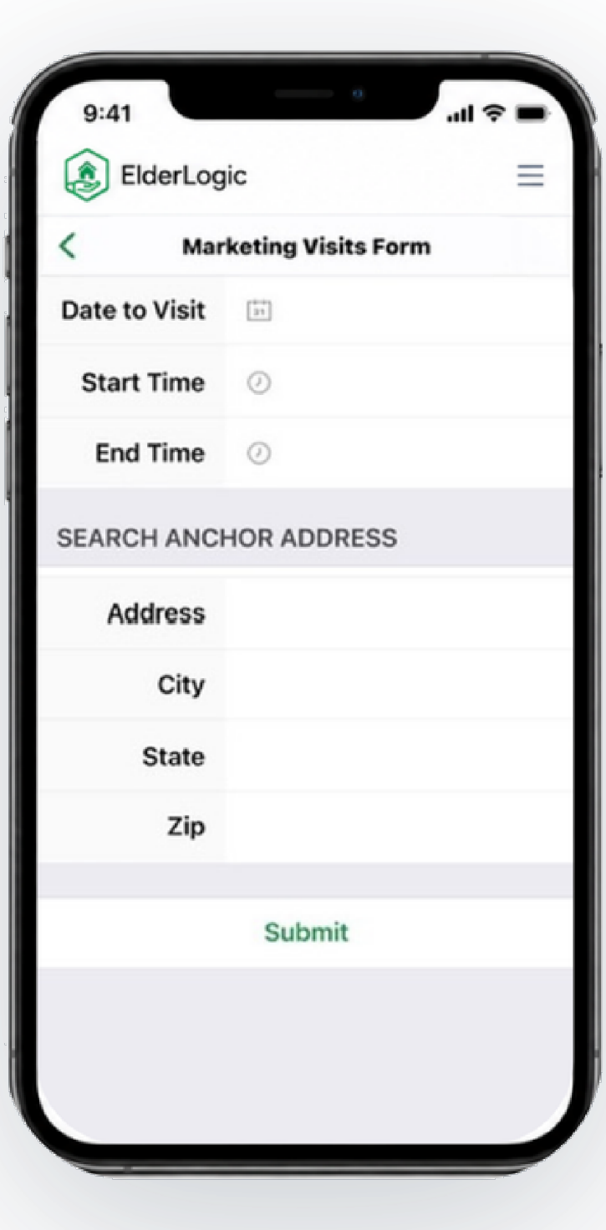
— The software

Territory routes for a liaison, built around an area and a date.

— Our staff

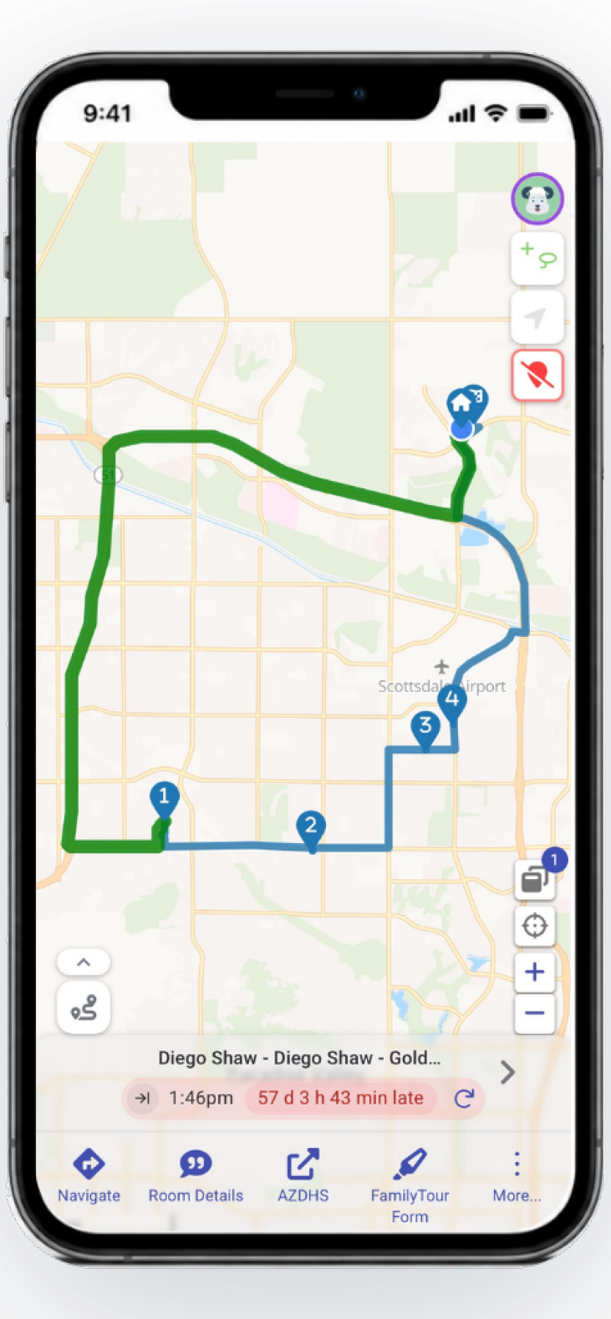
The database itself: deduplicated, contact details validated, refreshed every month.

Census is what an owner is measured on.



— Your team

A liaison picks a date, a time and an area. That is the whole set-up for a day in the field.



— Our staff

Before the rep leaves, we call the homes in that area with your placement pitch. The route is built around the ones that want the meeting.

Every licensed home inside the area comes back with contact details, its full state record and a driving order. The rep arrives somewhere that already agreed to see them: a resident who might fit, and no placement agent fee for the home to pay.

150
average lifetime days on service, referred from assisted living

87
average lifetime days on service, referred from home

`Source line needed before launch. These two figures are the most challengeable numbers on the page and need a named source and a date beside them.`

"We already have relationships."

You have relationships with the homes your reps can name. Those are worth keeping and this does not touch them. The rest of the territory is the part nobody has called, and those homes are referring to somebody.

The record is the state's. We keep it current.

Every home carries its full AZDHS history, not only its current status. It is on the home before anyone drives anywhere, and one click opens the official state file from anywhere in the workflow.

Placing a patient into a home with open enforcement is real exposure. This is when a team sees it.

This is built and maintained work, not a feed. The file is structured, deduplicated and refreshed monthly, and every home's phone number and email address is validated. That is why a rep can act on the map instead of looking a number up.

ARIZONA DEPT. OF HEALTH SERVICES

Refreshed 1 Aug 2026

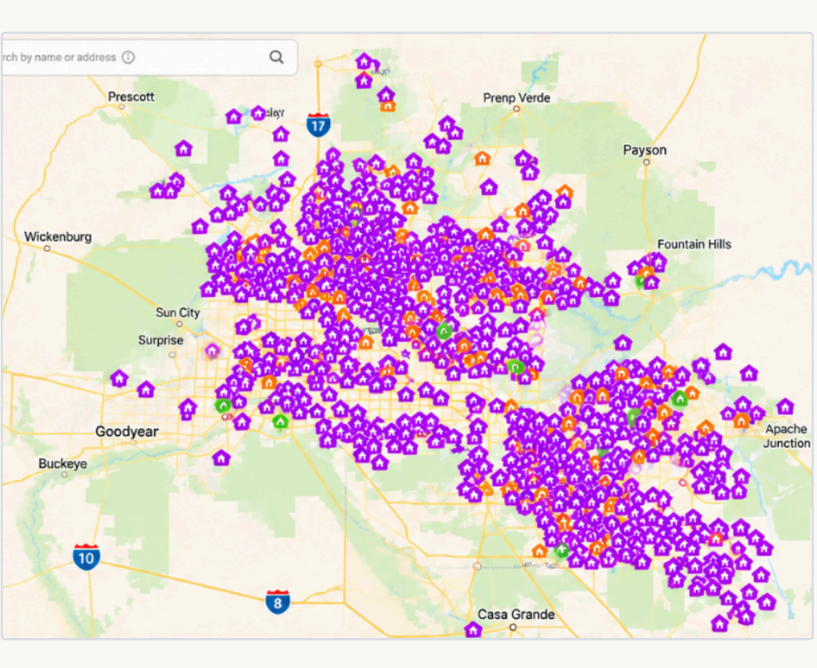
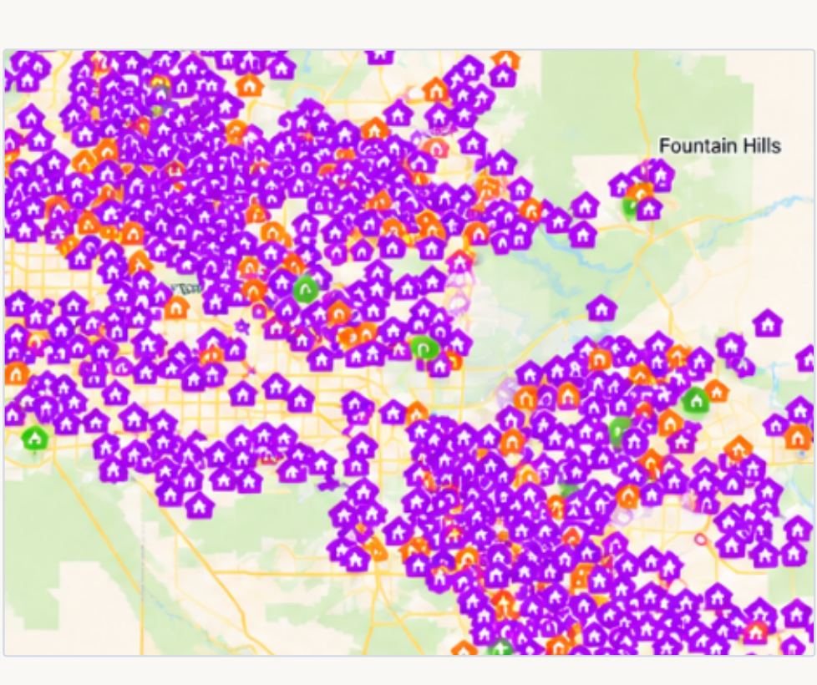
Source document	One click to AZDHS

ElderLogic does not rate, score or rank a home. It shows what the state published, and your team decides.

From the whole metro to one home's file.



1 · The metro. Every licensed home on screen.



2 · The East Valley. What a rep can drive in a day.

CAPTURE NEEDED

The map at neighbourhood zoom: a handful of separate homes on named streets, one of them selected.

3 · A neighbourhood. Homes you can tell apart.

CAPTURE NEEDED

Facility detail: name, address, validated phone and email, licence status and dates, inspection and violation history in date order, and the link out to the AZDHS file.

4 · One home. What the state published about it.

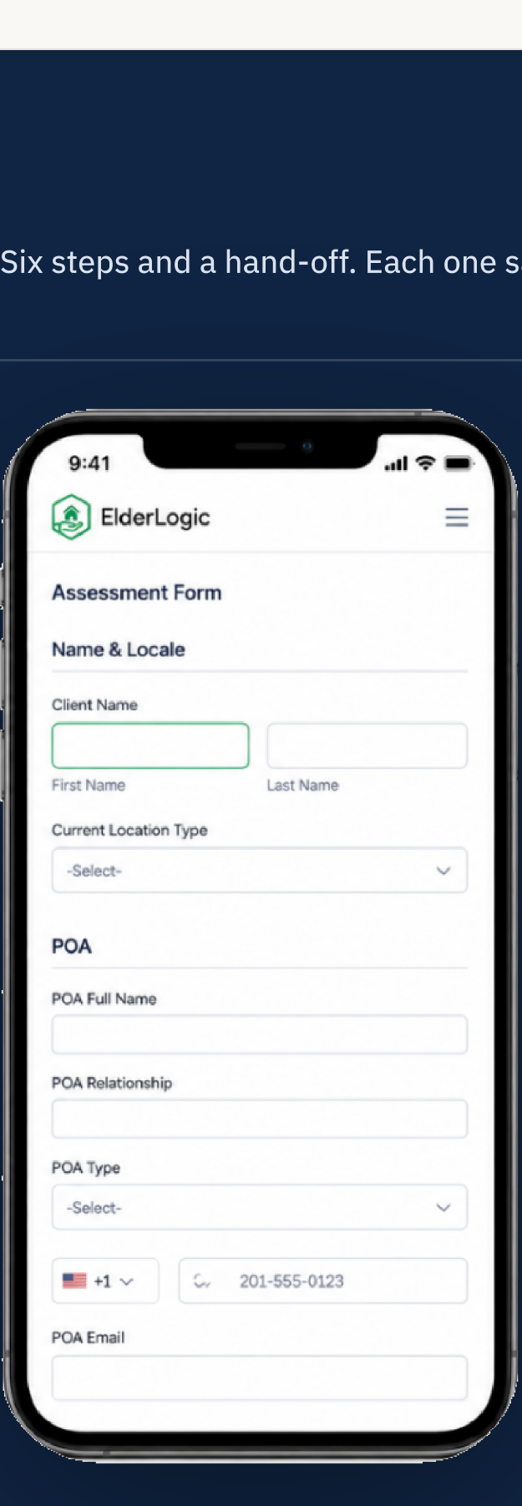
One placement, start to finish.

Six steps and a hand-off. Each one says who does it.

— Your team · 01

The assessment

One form creates the client record, the power-of-attorney record and the placement search together. Only the critical fields are required, so it can go out the same day the referral lands.



— The software · 02

The search

Every licensed home in range comes back against what this patient needs, each carrying its state record. Homes your organisation has ruled out are already gone.

SCREEN NEEDED

Placement search record: the client, the criteria applied, the count of homes returned, and the list with licence status visible on each row.

— Our staff · 03

The calls

We read the record, contact the homes, and ask the three questions that matter: is there a room, will you take this patient, what is the price. Every contact and every reply is logged against the search, so your team can see what was done rather than take our word for it.

200	in the radius
60	contacted
20	replied
5	room and price

`Provenance needed: are these figures typical, or from one Phoenix-area search? A line goes here before launch.`

SCREEN NEEDED

Outreach log: one row per home contacted for this search, with the date, the channel, who at ElderLogic made contact, and the reply. This is the artefact that proves the calling happened.

— Our staff · 04

The shortlist

A handful of homes with a confirmed room and an agreed price, each with its state record attached. Your coordinator decides which of them the family sees.

SCREEN NEEDED

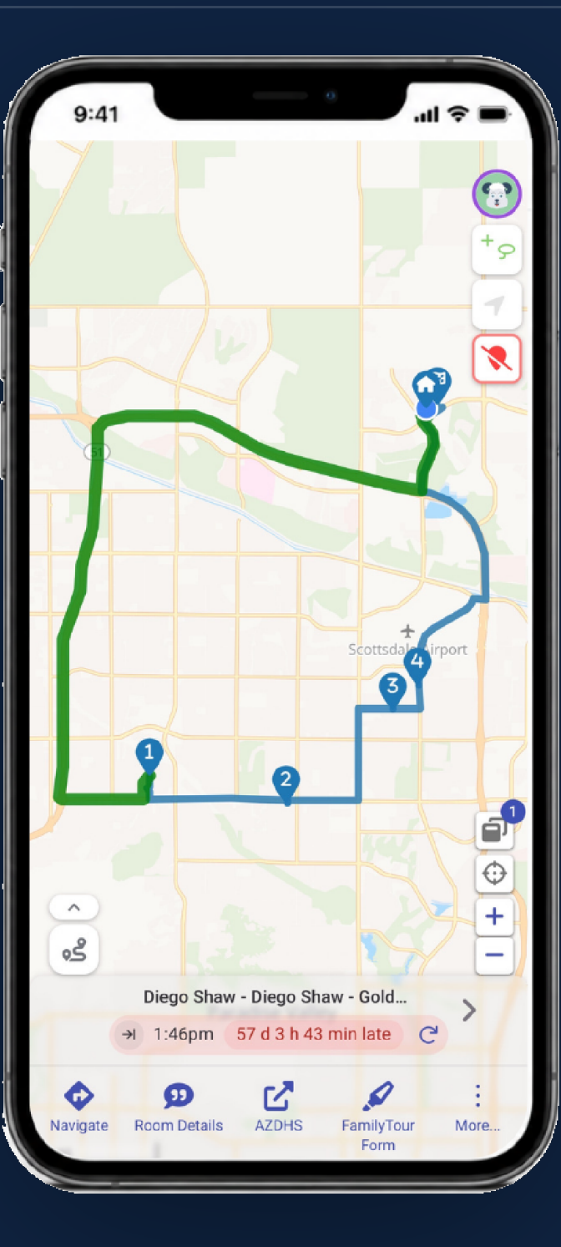
Shortlist for one client: home name, agreed price, room availability, distance, licence status, and a link to the full record on each.

— The software · 05

The routed day

The shortlist becomes stops in driving order on a phone, re-ordered when a visit runs long. At each stop the rep can navigate, open what the home said about this patient, or open the AZDHS record.

`Open: the same route can be sent to the family to drive themselves. Confirm whether that is public or internal only before this line goes on the page.`



— Your team · 06

The move-in, and what it leaves behind

Which client, which home, what price, what date. A short form after each visit records what the rep found. A home your team rules out is ruled out for the whole organisation and stays out of every future search.

SCREENS NEEDED

Post-visit form as filled at a stop, and the move-in record showing client, home, price and date. Both short enough to read at a glance.

What it costs you to start.

— Our staff

We set the account up, load your territory and your existing homes, and apply anything your organisation already rules out.

— Our staff

We train the liaisons. The rep-facing part is a form and a route, so this is short.

— Your team

One person on your side to name the territory and say who the users are.

`Needed from the client: how long setup actually takes, what support looks like after go-live, and whether there is a contract length. These are the manager's real questions and the page cannot answer them yet.`

RESERVED · FIRST CUSTOMER

A named hospice, the territory they cover, and one sentence in their words. Nothing goes here until there is a real one.

Questions

Which states do you cover?

Arizona. Every licensed senior living home in the state.

Where does the inspection data come from?

The Arizona Department of Health Services. Licensing, inspection, violation and enforcement history, published by the state.

Do you rate homes?

No. No scores, no rankings, no grades. We show the published record and your team reads it.

What if a home falls through after we have committed?

The search stays open. We go back to the homes that replied and to the ones we had not needed yet, and the shortlist is rebuilt the same day.

Can a manager see what the team actually did?

Yes. Completed and missed visits, activity by liaison, and move-ins recorded against clients.

Does it work on a phone?

Yes. Assessments, routes, home records and post-visit forms are all built for a phone, because that is where the work happens.

How long does setup take, and is there a contract length?

Ask on the call and we will give you the real numbers.

`Needed from the client: setup time, support model, contract length.`

Do we have to contact the homes ourselves?

No. Our staff do the calling for placement searches and for territory visits. Your team can contact a home directly at any point, and it is logged either way.

How current is it?

Refreshed monthly, with the refresh date shown. Contact details are validated in the same pass.

What if a home turns out to be unsuitable?

Your team rules it out once and it stays out of every future search for everyone in the organisation.

Is this more admin for my liaisons?

A liaison fills in a date, a time and an area, and fills a short form after each visit. The calling and the routing are not their work.

Does it replace our EMR or CRM?

No. It handles placement and territory work and sits alongside what you already run.

How is client health information handled?

The assessment carries patient information, so this needs a proper answer here.

`Needed from the client: how PHI is stored and who can see it, and whether a BAA is offered.`

How is it priced?

Monthly, per organisation and per user. We go through the numbers on the walkthrough.

Bring the territory you cover.

Forty minutes, on a call. You give us the area your liaisons work. We open the map on it and go through what is in it: how many licensed homes, what the state has published about them, and which ones nobody has contacted.

You leave with a picture of your own territory whether or not you buy anything. Bring the manager who would roll it out, if you can.

— Our staff Pull your territory and its records before the call.

— Your team Bring the counties or the zip codes you cover. Nothing else.
